

Project Title: System Verification and
Validation Plan for Simulating the Inverted
Pendulum system

Mina Mahdipour

T	Test

symbols, abbreviations or acronyms — you can simply reference the SRS
(?) tables, if appropriate

This document provides an introductory blurb and road map of the Verification and Validation plan.

3 General Information

3.1 Summary

Say what software is being tested. Give its name and a brief overview of its general functions.

This document provides test plans for the Simulating the Inverted Pendulum System Software. This Software aims to simulate and describe the behaviour of the system of a cart-pendulum, in the presence of different values of external force. To do that, it will calculate the cart position and pendulum's angle after applying the force.

3.2 Objectives

The objectives of this document are listed below:

- Make sure about software correctness.
- Demonstrate adequate usability.

3.3 Relevant Documentation

The Software Requirements Specification presents an overview of the problem and solution. The final report of running the test which described in this document, will be shown in VnV Report. ?

4 Plan

Introduce this section. You can provide a roadmap of the sections to come.

4.1 Verification and Validation Team

Our team includes:	Roles	Responsibility
	Supervisor	
	Writer	
	Reviwer	

4.2 SRS Verification Plan

List any approaches you intend to use for SRS verification. This may include ad hoc feedback from reviewers, like your classmates, or you may plan for something more rigorous/systematic.

Maybe create an SRS checklist?

4.3 Design Verification Plan

Plans for design verification

The review will include reviews by your classmates

Create a checklists?

4.4 Verification and Validation Plan Verification Plan

The verification and validation plan is an artifact that should also be verified.

The review will include reviews by your classmates

Create a checklists?

4.5 Implementation Verification Plan

You should at least point to the tests listed in this document and the unit testing plan.

In this section you would also give any details of any plans for static verification of the implementation. Potential techniques include code walk-throughs, code inspection, static analyzers, etc.

4.6 Automated Testing and Verification Tools

What tools are you using for automated testing. Likely a unit testing framework and maybe a profiling tool, like ValGrind. Other possible tools include a static analyzer, make, continuous integration tools, test coverage tools, etc. Explain your plans for summarizing code coverage metrics. Linters are another important class of tools. For the programming language you select, you should look at the available linters. There may also be tools that verify that coding standards have been respected, like flake9 for Python.

If you have already done this in the development plan, you can point to that document.

The details of this section will likely evolve as you get closer to the implementation.

4.7 Software Validation Plan

If there is any external data that can be used for validation, you should point to it here. If there are no plans for validation, you should state that here.

You might want to use review sessions with the stakeholder to check that the requirements document captures the right requirements. Maybe task based inspection?

This section might reference back to the SRS verification section.

5 System Test Description

5.1 Tests for Functional Requirements

Subsets of the tests may be in related, so this section is divided into different areas. If there are no identifiable subsets for the tests, this level of document structure can be removed.

Include a blurb here to explain why the subsections below cover the requirements. References to the SRS would be good here.

5.1.1 Area of Testing¹

It would be nice to have a blurb here to explain why the subsections below cover the requirements. References to the SRS would be good here. If

a section covers tests for input constraints, you should reference the data constraints table in the SRS.

Title for Test

1. test-id1

Control: Manual versus Automatic

Initial State:

Input:

Output: The expected result for the given inputs

Test Case Derivation: Justify the expected value given in the Output field

How test will be performed:

2. test-id2

Control: Manual versus Automatic

Initial State:

Input:

Output: The expected result for the given inputs

Test Case Derivation: Justify the expected value given in the Output field

How test will be performed:

5.1.2 Area of Testing2

...

5.2 Tests for Nonfunctional Requirements

The nonfunctional requirements for accuracy will likely just reference the appropriate functional tests from above. The test cases should mention reporting the relative error for these tests. Not all projects will necessarily have nonfunctional requirements related to accuracy

Tests related to usability could include conducting a usability test and survey. The survey will be in the Appendix.

Static tests, review, inspections, and walkthroughs, will not follow the format for the tests given below.

5.2.1 Area of Testing1

Title for Test

1. test-id1

Type: Functional, Dynamic, Manual, Static etc.

Initial State:

Input/Condition:

Output/Result:

How test will be performed:

2. test-id2

Type: Functional, Dynamic, Manual, Static etc.

Initial State:

Input:

Output:

How test will be performed:

5.2.2 Area of Testing2

...

5.3 Traceability Between Test Cases and Requirements

Provide a table that shows which test cases are supporting which requirements.

6 Unit Test Description

Reference your MIS (detailed design document) and explain your overall philosophy for test case selection. This section should not be filled in until after the MIS (detailed design document) has been completed.

6.1 Unit Testing Scope

What modules are outside of the scope. If there are modules that are developed by someone else, then you would say here if you aren't planning on verifying them. There may also be modules that are part of your software, but have a lower priority for verification than others. If this is the case, explain your rationale for the ranking of module importance.

6.2 Tests for Functional Requirements

Most of the verification will be through automated unit testing. If appropriate specific modules can be verified by a non-testing based technique. That can also be documented in this section.

6.2.1 Module 1

Include a blurb here to explain why the subsections below cover the module. References to the MIS would be good. You will want tests from a black box perspective and from a white box perspective. Explain to the reader how the tests were selected.

1. test-id1

Type: Functional, Dynamic, Manual, Automatic, Static etc. Most will be automatic

Initial State:

Input:

Output: The expected result for the given inputs

Test Case Derivation: Justify the expected value given in the Output field

How test will be performed:

2. test-id2

Type: Functional, Dynamic, Manual, Automatic, Static etc. Most will be automatic

Initial State:

Input:

Output: The expected result for the given inputs

Test Case Derivation: Justify the expected value given in the Output field

How test will be performed:

3. ...

6.2.2 Module 2

...

6.3 Tests for Nonfunctional Requirements

If there is a module that needs to be independently assessed for performance, those test cases can go here. In some projects, planning for nonfunctional tests of units will not be that relevant.

These tests may involve collecting performance data from previously mentioned functional tests.

6.3.1 Module ?

1. test-id1

Type: Functional, Dynamic, Manual, Automatic, Static etc. Most will be automatic

Initial State:

Input/Condition:

Output/Result:

How test will be performed:

2. test-id2

Type: Functional, Dynamic, Manual, Static etc.

Initial State:

Input:

Output:

How test will be performed:

6.3.2 Module ?

...

6.4 Traceability Between Test Cases and Modules

Provide evidence that all of the modules have been considered.

7 Appendix

This is where you can place additional information.

7.1 Symbolic Parameters

The definition of the test cases will call for SYMBOLIC_CONSTANTS. Their values are defined in this section for easy maintenance.

7.2 Usability Survey Questions?

This is a section that would be appropriate for some projects.

Appendix — Reflection

The information in this section will be used to evaluate the team members on the graduate attribute of Lifelong Learning. Please answer the following questions:

Appendix — Reflection

The information in this section will be used to evaluate the team members on the graduate attribute of Lifelong Learning. Please answer the following questions:

1. What knowledge and skills will the team collectively need to acquire to successfully complete the verification and validation of your project? Examples of possible knowledge and skills include dynamic testing knowledge, static testing knowledge, specific tool usage etc. You should look to identify at least one item for each team member.
2. For each of the knowledge areas and skills identified in the previous question, what are at least two approaches to acquiring the knowledge or mastering the skill? Of the identified approaches, which will each team member pursue, and why did they make this choice?
